Document description

This document describes the “Leerlingen” Web API and provides details required for a technical implementation. It defines the communication model to use when talking to the Web API, including the required security algorithms. It describes all of the available methods in detail and is illustrated with examples.

Ownership

This document is written and maintained by Informat.

API Basics

The provided webservice is implemented as a RESTful service, based on the principles defined by Roy Fielding in his doctoral dissertation at UC Irvine in 2000.

Representational state transfer (REST) is an abstraction of the architecture of the World Wide Web; more precisely, REST is an architectural style consisting of a coordinated set of architectural constraints applied to components, connectors, and data elements, within a distributed hypermedia system. REST ignores the details of component implementation and protocol syntax in order to focus on the roles of components, the constraints upon their interaction with other components, and their interpretation of significant data elements.

This chapter describes the basic information you need to interact with the services provided by Informat within the Leerlingen context.

Endpoint

The **production environment** is available via:

```
endpoint = leerlingenapi.informatsoftware.be
```

Versioning

The Leerlingen WEB API uses url embedded versioning to maintain backwards compatibility during its lifecycle. This means that we inject the version number in the request URL like this:

```
https://<endpoint>/<version>/<resource>
```

Example: `https://leerlingenapi.informatsoftware.be/1/{name}`

The version number will increase if a release introduces a breaking change or a significant change in the WEB API implementation. The version number is noted on the first page of this documentation and in the footer of each page.

The current API version number is **1**

Using this allows users to upgrade their implementations at their own pace. If a release creates a change that will break the workings of previous versions, e.g. a change in the underlying data structure, or if a significant change in the internal logic is added, this will be announced at least 1 month in advance, to allow time for client implementations to upgrade. These changes will be kept to a minimum, and where possible bundled, to guarantee consistent availability.

Character sets

All service response objects will be formatted with UTF-8 encoding to ensure compatibility with most languages.

Request Format and Responses

Request verbs

All request data should be specified in the JSON format.

As per the definition of RESTful services, you can use HTTP verbs to issue different commands to the service.

Normally, you would use `GET` requests to read data from the service, but in order to allow future expansion of methods, all `GET` requests are required to be sent with the `POST` verb.

If you use an unsupported HTTP request type with a URL that does not support the specified verb, a `405` HTTP error will be returned, listing the supported HTTP methods for that URL.

Example:

```
HTTP/1.1 405 Method Not Allowed
Content-Length: 94
Content-Type: application/json
Date: Fri, 18 Oct 2019 10:48:36 GMT
{
}
```

JSON Basics

The majority of requests and responses to the WEB API use the JavaScript Object Notation (JSON) for formatting the content and structure of the data and responses.

JSON is used because it is the simplest and easiest solution for working with data within a web browser, as JSON structures can be evaluated and used as JavaScript objects within the web browser environment.

JSON supports the same basic types as supported by JavaScript, these are:

- **Number** (either integer or floating-point).
- **String**; this should be enclosed by double-quotes and supports Unicode characters and backslash escaping. For example: "A String"
- **Boolean** - a true or false value. You can use these strings directly. For example: { "value": true }
- **Array** - a list of values enclosed in square brackets. For example: ["one", "two", "three"]
- **Object** - a set of key/value pairs (i.e. an associative array, or hash). The key must be a string, but the value can be any of the supported JSON values. For example:

```
{
  "servings" : 4,
  "subtitle" : "Easy to make in advance, and then cook when ready",
  "cooktime" : 60,
  "title" : "Chicken Coriander"
}
```

Handling dates (and time)

Dates should always be sent to the server in either UTC format or using the yyyy-MM-dd (hh:mm:ss) notation.

Example:

```
2019-09-30T15:30:22.000Z          // Valid UTC Format
2019-09-30T15:30:22+0100         // Valid UTC Format
2019-09-30
2019-09-30 15:30:22
```

If you're using javascript Date() objects in your request body, your browser will automatically convert these to the UTZ format.

Example:

```
// javascript
var someDate = new Date(2019,05,21) // will be sent as 2019-05-21T00:00:00.000Z
```

If you need to send a date and time object, use the UTC format or use yyyy-MM-dd hh:mm:ss

Example:

```
2019-09-30T22:30:00.000Z          // UTC Format
2019-09-30 22:30:00
```

Boolean

Booleans should always be formatted as true/false (lower case, no quotation marks).

Example:

```
{
  "isAdmin": true,
  "canAccess": false
}
```

Response format

The API can return data in both JSON and XML format. To change the return type of the data, add the "Accept" header to your request with the correct value corresponding to the desired response.

application/json for a JSON formatted response

application/xml for an XML formatted response

The response object will always contain the following fields:

Field	Type	Availability	Description
resultCode	integer	always	Contains a code that describes the status of the request. This code is an addition to the HTTP status code. A list of possible result codes can be found at the end of this document.
resultMessage	string	always	This field contains a short user friendly description of the returned result code.
resultDetails	object	Optional	This field sometimes contains extra details about the request, e.g. specific details regarding a server side error, or a problem with the request body. The content of this field is method/action specific and more details can be found in the resources chapter and in the list of result codes.

HTTP Headers

Because the WEB API uses HTTP for all communication, you need to ensure that the correct HTTP headers are supplied (and processed on retrieval) so that you get the right format and encoding. Different environments and clients will be more or less strict on the effect of these HTTP headers (especially when not present). Where possible you should be as specific as possible.

Request Headers

Content-type

Specifies the content type of the information being supplied within the request. The specification uses MIME type specifications. For the majority of requests this will be JSON (`application/json`). For some settings the MIME type will be plain text. When uploading attachments it should be the corresponding MIME type for the attachment or binary (`application/octet-stream`).

The use of the correct `Content-type` header on a request is required, unless the body is empty.

Accept

Specifies the list of accepted data types to be returned by the server (i.e. that are accepted/understandable by the client). The format should be a list of one or more MIME types, separated by colons.

For the majority of requests the definition should be for JSON data (`application/json`). For attachments you can either specify the MIME type explicitly, or use `*/*` to specify that all file types are supported. If the `Accept` header is not supplied, then the `*/*` MIME type is assumed (i.e. client accepts all formats).

The use of `Accept` in queries for Leerlingen is not required, but is highly recommended as it helps to ensure that the data returned can be processed by the client.

If you specify a data type using the `Accept` header, Leerlingen will honor the specified type in the `Content-type` header field returned. For example, if you explicitly request `application/json` in the `Accept` of a request, the returned HTTP headers will use the value in the returned `Content-type` field.

For example, when sending a request without an explicit `Accept` header, or when specifying `*/*`:

```
POST /1/department HTTP/1.1
Host: leerlingenapi.informatsoftware.be:443
Accept: */*
```

The returned headers are:

```
Server: Microsoft IIS/8.8
Date: Fri, 19 Oct 2019 14:28:53 GMT
Content-Type: text/plain; charset=utf-8
Content-Length: 227
Cache-Control: no-cache
```

Note that the returned content type is `text/plain` even though the information returned by the request is in JSON format.

Explicitly specifying the `Accept` header:

```
POST /1/department HTTP/1.1
Host: leerlingenapi.informatsoftware.be:443
Accept: application/json
```

The headers returned include the `application/json` content type:

```
Date: Fri, 19 Oct 2019 14:28:53 GMT
Content-Type: application/json
Content-Length: 227
Cache-Control: no-cache
```

Response Headers

Response headers are returned by the server when sending back content and include a number of different header fields, many of which are standard HTTP response header and have no significance to Leerlingen operation. The list of response headers important to Leerlingen are listed below.

HTTP Status Codes

With the interface to Leerlingen working through HTTP, error codes and statuses are reported using a combination of the HTTP status code number, and corresponding data in the body of the response data.

A list of the error codes returned by the WEB API, and generic descriptions of the related errors are provided below. The meaning of status codes for specific request types is provided in the corresponding API call reference.

Code	Text	Description
200	OK	Request completed successfully.
400	Bad Request	Bad request structure. The error can indicate an error with the request URL, path or headers. Differences in the supplied MD5 hash and content also trigger this error, as this may indicate message corruption.
401	Unauthorized	The item requested was not available using the supplied authorization, or authorization was not supplied.
403	Forbidden	The requested item or operation is forbidden.
404	Not Found	The requested content could not be found.
405	Resource Not Allowed	A request was made using an invalid HTTP request type for the URL requested. For example, you have requested a PUT when a POST is required. Errors of this type can also triggered by invalid URL strings.
406	Not Acceptable	The requested content type is not supported by the server.
409	Conflict	Request resulted in an update conflict.
415	Bad Content Type	The content types supported, and the content type of the information being requested or submitted indicate that the content type is not supported.
416	Requested Range Not Satisfiable	The range specified in the request header cannot be satisfied by the server.
500	Internal Server Error	The request was invalid, either because the supplied JSON was invalid, or invalid information was supplied as part of the request.

Usage restrictions

To be able to balance the load on our servers and the impact on our overall performance, this service requires client implementations to comply with some basic rules. In case a specific resource or method requires additional rules, these will be added to the corresponding chapters.

Ground rules

- Cache retrieved data as much as possible, use the provided ID's and references to maintain data consistency.
- The privacy and security of the private key is the responsibility of the end user. In case the private key is compromised, the end user is required to inform Informat as soon as possible. We will then take the necessary steps to ensure the safety of the data. A new private key will then be issued.

Privacy concerns

The user is responsible for the safe and correct processing of all personal data, conform privacy regulations, as is stipulated in the contract between the user and the supplier, Informat.

Disclaimer

All requests to the service are logged and monitored to aid in the improvement of the service, to help troubleshoot issues and to avoid abuse.

If Informat finds that the user is found guilty of abuse, Informat reserves the right to terminate the users' access to the service if the abuse continues after multiple warnings.

Security

Transport security

Secure Socket Layer

To ensure the safety of the transferred data and to prevent data-theft, this service operates only via HTTPS.

Transport Layer Security (TLS) and its predecessor, Secure Sockets Layer (SSL), are cryptographic protocols designed to provide communication security over the Internet. They use X.509 certificates and hence asymmetric cryptography to authenticate the counterparty with whom they are communicating, and to exchange a symmetric key. This session key is then used to encrypt data flowing between the parties. This allows for data/message confidentiality, and message authentication codes for message integrity and as a by-product, message authentication.

Authentication endpoint

The **production environment** is available via:

```
identityEndpoint = https://www.identityserver.be
```

Request authentication

Modern secure applications often use access tokens to ensure a user has access to the appropriate resources, and these access tokens typically have a limited lifetime. This is done for various security reasons: for one, limiting the lifetime of the access token limits the amount of time an attacker can use a stolen token. Also, the information contained in or referenced by the access token could become stale.

Calling resources without Access Token

When trying to access the API without Access Token, an Unauthorized response will be returned.

```
HTTP/1.1 401 Unauthorized  
WWW-Authenticate: Bearer
```

Getting an Access Token by client credentials

The Client Credentials grant type is used by clients to obtain an access token by using a clientId and clientSecret.

Client Credentials Grant Flow

Getting access for 1 or multiple scopes

A scope is a permission that is set on a token, a context in which that token may act.

For example, a token with the **api_informat_sas_leerlingen.voorinschrijvingen.123456** scope is permitted to read or write data to the leerlingenapi for the specified institute number, 123456 in this example. Otherwise you would be denied access.

You can request access for 1 scope but it's also possible to request a token for multiple scopes. See the following examples.

Note: The scope has two flavors:

- The pre-registrations calls use the pattern **api_informat_sas_leerlingen.voorinschrijvingen.{instituteNo}**;
- The pupil related calls use the pattern **api_informat_sas_leerlingen.leerlingen.{instituteNo}**.

The pattern that applies, is listed in each main section (green colored).

Request token for pre-registrations calls - 1 scope

Request

```
POST https://<identityEndpoint>/connect/token HTTP/1.1
...
Content-Type: application/x-www-form-urlencoded

grant_type: client_credentials
client_id: <received client id>
client_secret: <received client secret>
scope: api_informat_sas_leerlingen.voorinschrijvingen.123456
```

[illegible]

```
POST https://<identityEndpoint>/connect/token HTTP/1.1
...
Content-Type: application/x-www-form-urlencoded

grant_type: client_credentials
client_id: <received client id>
client_secret: <received client secret>
scope: api_informat_sas_leerlingen.voorinschrijvingen.123456
api_informat_sas_leerlingen.voorinschrijvingen.456789
```

[illegible]

Request token for **pupil related** calls - 1 scope

Request

```
POST https://<identityEndpoint>/connect/token HTTP/1.1
...
Content-Type: application/x-www-form-urlencoded

grant_type: client_credentials
client_id: <received client id>
client_secret: <received client secret>
scope: api_informat_sas_leerlingen.leerlingen.123456
```

Response

[illegible]

Request token for **pupil related** calls - multiple scopes

Doing a request for multiple scopes can be done by defining all the scopes, separated by a single space.

Request

```
POST https://<identityEndpoint>/connect/token HTTP/1.1
...
Content-Type: application/x-www-form-urlencoded

grant_type: client_credentials
client_id: <received client id>
client_secret: <received client secret>
scope: api_informat_sas_leerlingen.leerlingen.123456 api_informat_sas_leerlingen.leerlingen.456789
```

Response

```
{  
  "access_token": "eyJhbGciOiJIUzI1NiIsImtpZCI6IjYyOEM3NzFEM0FCNEI0Rjk4MzRFODkyMTcyMTc2OTk5NjkyNTZFOWEiLCJ0eXAiOiJKV1QiLCJ4NXQoiOiJzb3gzSFRxMRHQURUb2toY2hkcGIxa2xiaWZlbnRpdHlwZXJ2ZXIxZWYwLy93d3cuYWRLbnRpdHlwZXJ2ZXIuYmUvcmVub3VyY2VzIiwiaXNjb3B1IjpbImFwaV9pbmVzcmlhdF9zYXNfbGVlcXpmdlb1bi52b29yaW5zY2hyaWpw2aW5nZW4udMDMyODQ3Il19.vfTPZYPGGsbb14vy1S-FjdvpQTdlct5m4E2mWFPqPMRBQINQBInfxPH8DUu5cMRvcTFJxCeAsm33Rf-myojr1qvBYilrKgmbIth_gyCNAychUBAUsd-nYIIIV3Jz20_zML13gklUL48fCYc-hwt1rbS4urIPhQxDd_sdsNyvvUJB9DgmCdXuogBm0cvzmVvhLH6Fpez-ttQ5Aymjsj0dx0JVAIItVvxVHPQRWA33Sl1ISvog0jfjHP437d4ztFOjzAGUHglw04ef10ALed8D1w3CqJAJOaqPW9ttPTATUPvwKQ2xyAgil1kpsejtPpoRCd176vjv9i3b1dxPiw6fcVffemUGuetub818mhVED0eYEDKUtmZtp_bAhU5suqeOC3GCjtgwc9TfjTqlTdgneEfghX81TZIKh2th4z5SOROKt5Sq5RtnN9U9WDrci2Dqrftk5pNg7leMIImqF8AsvuYp5rxXGR-HYWN2YBluf2YTwiawocshixjdzV4",  
  "expires_in": 3600,  
  "token_type": "Bearer",  
  "scope": "api_informat_sas_leerlingen.leerlingen.123456 api_informat_sas_leerlingen.leerlingen.456789"  
}
```

Use of access token

Each API Request must send with the access token as follows

Authorization: BEARER <token>

Example

[illegible]

Request

It is mandatory that you provide some information with every request:

- A timestamp
- Your institute number

Institute number

Your institute is added as a header to **every** request. This header is called "InstituteNo".

Note that header names are case-insensitive.

C# coding example

```
Request.Headers.Add("InstituteNo", "999999");
```

Please make sure that you only add this header once to the request, if you try to add it twice (or with multiple values), the header will be sent as a comma-separated list of values.

Timestamp

You need to add a timestamp header to every request, containing the current date and time, in UTC format.

The timestamp header looks like this:

```
Timestamp: 2019-10-15T15:30:22.000
```

The following format is also acceptable:

```
Timestamp: 2019-10-15T15:30:22+0100
```

Resources

This chapter lists all the resources available on the webservice. A resource can be thought of as an entity which you can get data for.

By default, calling a resource directly will provide you with a list of that resource, while adding an identifier to the URL will retrieve data for a unique resource.

For example: calling `/<endpoint>/students` will get you a list of students, while calling `/<endpoint>/students/123` will get you the data for the specific student with ID 123.

On a unique resource, like student 123, you can call other linked resources, to get specific data related to that student. For example, calling `/<endpoint>/students/123/history` will get you a dataset that contains the students' history.

Pre-registrations

This chapter describes how to:

- Add your reservation data into Informat as a Pre-registration
- Update an existing pre-registration based on the preRegistrationId
- Delete an existing pre-registration by its preRegistrationId
- Get the status of a pre-registration/registration by its preRegistrationId
- Get an overview of registered pre-registrations by instituteNo and school year

It describes all the available methods, their request/response format and provides input/output examples.

Scope pattern: api_informat_sas_leerlingen.voorinschrijvingen.{instituteNo}

POST /preregistrations/save

This call can be used to:

- Add your new online reservation into Informat as a Pre-registration;
- Update an existing pre-registration based on the preRegistrationId;
- Add an "update personal details"-registration by using "000000" as admgrpId (means no admgrp), used when the original pre-registration is already accepted and can no longer be changed;
- Update an existing "update personal details"-registration based on the preRegistrationId provided during addition.

When updating, several MNA (Method Not Allowed) validation-errors can be thrown. An overview can be found over [here](#).

Request

Headers

Besides the mandatory headers, no other custom headers are required.

URL

No url parameters required.

Body

Field	Type	Required/optional	Description
lastName	string	required	Pupil's last name Validation: required and max. 50 characters
firstName	string	required	Pupil's first name Validation: required and max. 50 characters
additionalNames	string	optional	Additional names of the pupil Validation: max. 160 characters
dateOfBirth	date	required	Date of birth Format: valid UTC Date or yyyy-MM-dd Validation: required and valid
countryOfBirthCode	string	required	Country of birth code must be one of the official country code. Validation: length must be 5 characters and must be an official country code.
placeOfBirthCode	string	optional	Place of birth code is a postal code. If the country of birth is Belgium then it must be an official BE postal

Field	Type	Required/optional	Description
			code. Validation: max. 10 characters
placeOfBirth	string	optional	Place of birth. Validation: max. 50 characters
nationalityCode	string	required	Nationality code must be one of the official nationality codes. Validation: length must be 5 characters and must be an official code.
sex	integer	required	Possible values for the sex are: 1 or 2 1 = male 2 = female Validation: must have a value of 1 or 2
insz	string	optional	The pupil's identification number. This is either the Bisnummer, for foreign pupil, or Rijksregisternummer for Belgium residents. Format: "yymmddxxxxx" Example: "85073115025" Validation: Validates the number, no check on date of birth or gender.
eldNo	string	optional	Some (electronic) residence documents provide/contain an Id number. This number can be stored by filling up this field. Validation: max. 12 characters
eldPhoto	string	optional	Some electronic residence documents provide a photo of the owner. The data must be offered as a delimited string.
mobilePhone	string	optional	Own mobile number Validation: max. 20 characters
email	string	optional	Private email address Validation: Validation on email-address format
nameOfDoctor	String	optional	Name of the pupil's doctor Validation: max. 100 characters
phoneOfDoctor	String	optional	Phone of the pupil's doctor Validation: max. 20 characters
firstLanguage	string	optional	Validation: max. 100 characters
isHomeless	boolean	required	Indicates whether the pupil is someone who changes shelter or place of residence frequently.
migrating	boolean	required	Indicates whether the pupil belongs to the migratory (trekkende) population.
isIndicatorPupil	boolean	required	Indicates whether the pupil is an indicator pupil. A pupil who meets at least one of the official indicators, will be assigned as an indicator pupil.
religion	integer	optional	Also known as levensbeschouwing.

Field	Type	Required/optional	Description
			Example: 63 Possible values: 52 = Cultuurbeschouwing 63 = Eigen cultuur en religie 135 = Islamitische godsdienst 136 = Israëlitische godsdienst 140 = Katholieke godsdienst 187 = Niet-confessionele zedenleer 194 = Orthodoxe godsdienst 225 = Protestants-evangelische godsdienst 418 = Anglicaanse godsdienst 9999 = Vrijstelling of niet van toepassing Validation: must be one of the possible values
priorityGroup	integer	optional	Priority group, also known as voorrangsgroep Example: 1 Possible values: 1 = Dezelfde leefentiteit 2 = Kind van personeelslid 3 = Kind met minstens 1 ouder die het Nederlands machtig is 4 = Campusleerling 5 = Indicator- of niet-indicatorleerling 6 = Geen Validation: must be one of the possible values
reasonForRefusal	integer	optional	Example: 19 Possible values: 19 = capaciteit Validation: must be one of the possible values
Relationships	array	optional	Validation: MAX(2)
type	integer	required	Type of relationship. Example: 13 Possible values: 0 = leerling 13 = vader 14 = moeder 5 = plusvader 6 = plusmoeder 2 = voogd 9 = grootvader 10 = grootmoeder 7 = pleegvader 8 = pleegmoeder Note: Type 0 (leerling) isn't an official relationship type. The purpose of this type is to be able to send the address of an adult pupil without creating a relationship. Can, for example, be applied to nursing. Consequently, it doesn't really make sense to define lastName, firstName, insz, phone, ... in this case. Validation: must be one of the possible values

Field	Type	Required/optional	Description
lastName	string	required / optional	Relation's last name Note: This field is only optional in combination with type 0 (leerling). Validation: required and max. 50 characters
firstName	string	required / optional	Relation's first name Note: This field is only optional in combination with type 0 (leerling). Validation: required and max. 30 characters
Address	object	optional	
streetName	string	required	Street name Validation: max. 50 characters
houseNo	string	required	Includes the House number & Alpha number Validation: max. 10 characters
houseBusNo	string	optional	Bus number Validation: max. 6 characters
postalCode	string	required	Postal code must be an official one. Validation: max. 8 characters
city	string	required	City. Validation: max. 30 characters
countryCode	string	required	Country code must be one of the official country codes. Validation: length must be 5 characters and must appear in the list of "countries".
isDomicileAddress	boolean	required	Indicates whether the defined address is a domicile address
isWritingAddress	boolean	required	Indicates whether the defined address is a writing address
isResidenceAddress	boolean	required	Indicates whether the defined address is residence address
phone	string	optional	Domicile phone number Validation: max. 20 characters
mobilePhone	string	optional	Own mobile number Validation: max. 20 characters
email	string	optional	Private email address Validation: Validation on email-address format
insz	string	optional	The relation's national registration number. This is either the Bisnummer, for foreign pupil, or Rijksregisternummer for Belgium residents. Format: "yymmddxxxxx" Example: "85073115025" Validation: Validates the number

Field	Type	Required/optional	Description
preRegistrationId	GUID	required	A mandatory unique identifier which will be used to identify the pre-registration. Other calls like the update, consult, ... are based on this Id. Validation: Id Not empty
schoolyear	string	Required	The school year in which the pupil's registration takes place. Validation: format: "2019-20"
institute	string	required	Official institute number Validation: 6 characters (digits)
structure	string	required	'Hoofdstructuur' of the institute (111, 311,...) Validation: 3 characters
locationId	string	required	Official Discimus location number Validation: 3 characters (digits) & if formatted correctly, a check is done to verify whether this id exists within the students admin module for the provided instituteNo and school year. See error code "BR037C" for the error description.
admgrpId	string	required	Official education number (Administratieve groep) Validation: 6 characters (digits) and must be an existing admgrp
admgrpDetail	string	optional	Additional information about the education (1ste jaar kleuter, Latijn,...) Validation: max 200 characters
preRegistrationDate	date	optional/ required	Pre-registration date and time of the online reservation/pre-registration. Format: valid UTC Date Validation: Pre-Registrationdate is only required if admgrpId is not equal to "000000" (no admgrp). And if provided, this date must be on or before the Start Date.
startDate	date	required	The date the pupil starts the lessons. Startdate shouldn't be Saturday or Sunday, except on September 1 st . Note: September 1 st of the next school year is also valid, but only if the toddler is younger than 2.5 years on the last entry date (being the first school day after Ascension Day of the provided school year). Format: valid UTC Date or yyyy-MM-dd Validation: Start Date is required and must be between beginning and end of defined school year or 01.09 of next school year for toddlers under minimum age (see note).
registrationStatus	integer	required	Possible values for the registration status: 0 or 1 0 = Realized (gerealiseerd) 1 = Not realized (niet-gerealiseerd)

Field	Type	Required/optional	Description
			Validation: Must have a value of 0 or 1.
remark	string	optional	Remark on registration level Validation: no length validation.
assignedViaRegistrationSystem	boolean	optional	Indicates whether this pre-registration is assigned via a registration system (aanmeldingssysteem). The (default) value is false, if not provided. Format: true or false

Responses

A response without validation errors, contains a “preRegistrationStatus”-object.

Field	Type	Description
preRegistrationId	GUID	Unique identifier which identifies the pre-registration. Determined during the creation of the pre-registration.
status	string	Status of the pre-registration. The status will always be “open” after a creation. Possible values: open, accepted, refused

Example request

```

```

DELETE /preregistrations/{preRegistrationId}

Delete your online Pre-registration data.

Request

Headers

Besides the mandatory headers, no other custom headers are required.

URL

Field	Type	Required/optional	Description
-------	------	-------------------	-------------

GET /preregistrations/{preregistrationId}/status

Gets the status of a pre-registration/registration by its preRegistrationId. This is the same response as you should get after a successful save operation.

Request

Headers

Besides the mandatory headers, no other custom headers are required.

URL

Field	Type	Required/optional	Description
preRegistrationId	GUID	required	The unique identifier of the pre-registration/registration. Format: D919481D-6AFD-402C-B97E-795A8075503B

Body

This request has an empty body.

Response

The response contains the "preRegistrationStatus"-object, mentioned earlier.

Field	Type	Description
preRegistrationId	GUID	Unique identifier which identifies the pre-registration. Determined during the creation of the pre-registration.
status	string	Status of the pre-registration/registration. Possible values are: open, accepted, refused

Example request

Request

```
GET https://<endpoint>/<version>/preregistrations/D919481D-6AFD-402C-B97E-795A8075503B/status HTTP/1.1

    }
  ],
  "status": 404,
  "message": "Data not found exception"
}
```

GET /preregistrations?schoolYear={schoolYear}

Gets all pre-registrations for a given institute number and school year.

The institute number is defined via the mandatory header "InstituteNo" and the school year must be send via the URL.

Request

Headers

Besides the mandatory headers, no other custom headers are required.

URL

Field	Type	Required/optional	Description
schoolYear	string	required	Limits the output results to pre-registrations in a study field for he given school year. Format: "2025-26" If not provided a bad request with error code "BR001" and message "Invalid school year" will be returned.

Body

This request has an empty body.

Response

The response contains a list of pre-registrations.

Field	Type	Description
naam	string	Student's last name.

voornaam	string	Student's first name.
geslacht	int	Student's gender. Possible values: 1 = male 2 = female
rrn	string	Student's national registration number for Belgium residents. Format: "yymddxxxxx" if provided
geboortedatum	date	Student's date of birth. Format: yyyy-MM-dd or null if empty
geboorteland	string	Student's country of birth.
geboorteplaats	string	Student's place of birth.
nationaliteitCode	string	Student's official nationality codes.
gsm	string	Student's own mobile number.
email	string	Student's private email address.
lpvs	array	List of school attendance officers (LPV's). Note: a LPV is only included in the list if at least one of the following fields was filled in: type (> 0), name, or first name.
lpv	integer	Indicates if it's the first or second school attendance officer (LPV).
type	integer	Type of LPV. Possible value: Vader, Moeder, ...
naam	string	LPV's last name.
voornaam	string	LPV's first name.
burgerlijkeStand	string	LPV's civil status. Possible value: Gehuwd, Gescheiden, ...
gsm	string	LPV's own mobile number.
telefoon	string	LPV's domicile phone number.
email	string	LPV's private email address.
straat	string	Street name.
huisNr	string	House number & Alpha number.
bus	string	Bus number.
postcode	string	Postal code (main).
gemeente	string	Town (main).
landcode	string	Country code.
isDomicilieAdres	bool	Indicates whether this address is a domicile address.
nrAdmgrp	string	Official education number (Administratieve groep) for which the student is pre-registered.
richting	string	Name of the study field for which the student is pre-registered.
admgrpDetail	string	Additional information about the education (1ste jaar kleuter, Latijn,...)
hfdStructuur	string	Main structure of the institute. Possible value: 111, 311, ...

vestigingsnrDiscimus	string	Official Discimus location number.
aanmeldingstijdstip	date	Pre-registration date and time of the online reservation/pre-registration.
begindatum	date	The date the student starts the lessons. Startdate shouldn't be Saturday or Sunday, except on September 1st.
creatietijdstip	date	Timestamp the pre-registration was added.
opmerking	string	Remark on pre-registration level.
status	string	Status of the pre-registration/registration. Possible values: 'open', 'geaccepteerd' and 'geweigerd'
dataProviderId	integer	The source that provided the data. Possible values: 1 = API 2 = Import students 3 = Pre-registration module

Registrations

This chapter describes how to:

- Get all registrations for an institute number and school year.

It describes all the available methods, their request/response format and provides input/output examples.

Scope pattern: api_informat_sas_leerlingen.leerlingen.{instituteNo}

GET /registrations?schoolYear={schoolYear}&changedSince={changedSince}

Gets all the registrations for the combination institute number and school year. The institute number is defined via the mandatory header "InstituteNo" and the school year must be send via the URL.

Request

Headers

Besides the mandatory headers, no other custom headers are required.

URL

Field	Type	Required/optional	Description
schoolYear	string	required	Limits the output results to registrations within the given schoolyear. Format: "2022-23" If not provided a bad request with error code "BR001" and message "Invalid school year" will be returned.
changedSince	date	optional	Limits the output results to those registrations whose data has been changed since a certain date. Our internal "changedSince" date is determined based on a collection of change dates at different levels (depending on the content of the response). No results will return in case: • nothing has been changed; • the "changedSince"-date sent, lays too far in the past.

Body

This request has an empty body.

Response

The response contains a list of registrations.

Field	Type	Description
inschrijvingsId	GUID	Unique identifier for the registration Format: {42CD5A20-E22F-45D7-973C-FAB8734DEC50}
pInschr	Integer	Unique integer-value for the registration within the database Note: This value may have changed after data migration. Therefore, the inschrijvingsId is more suitable as a reference value.
pPersoon	Integer	Unique integer-value for the student within the database
persoonId	GUID	Unique identifier for the student Format: {42CD5A20-E22F-45D7-973C-FAB8734DEC50}

instelnr	String	Official institute number of the school Format: 6 characters (digits)
hfdstructuur	String	Structure of the institute (111, 311,...)
school	String	Descriptive name of the school
stamn	String	Students' stamnummer Format: 9 characters (digits) or null if not available
vestCode	String	Own defined location code
vestiging	String	Own descriptive name of the location
vestnrDiscimus	Integer	Discimus location number
begindatum	Date	Date the registration starts Format: : yyyy-MM-dd
einddatum	Date	Date the registration ends Format: : yyyy-MM-dd or null if empty
afdCode	String	Own defined department code
afdeling	string	Own defined department description.
nrAdmgrp	string	Official education number (Administratieve groep) Format: 6 characters (digits)
afdelingsjaar	string	Department year
afdelingsjaarOptie	string	Chosen option/specialization associated with a department year
status	integer	Registration status Possible values: 0 = Gerealiseerd 1 = Niet-gerealiseerd 2 = Uitgesteld 3 = Parallel 4 = Geannuleerd
graad	string	Degree
leerjaar	int	Grade
taalkeuze	string	Choice of language-options
finCode	string	Finance ability code Possible values secondary education: 01 = Vrije leerling 02 = Regelmatig / financierbaar 03 = Regelmatig / niet financierbaar 11 = Vrije leerling in erkende privéschool 13 = Regelmatige leerling in erkende privéschool 20 = Financierbare GON-leerling 22 = Niet-financierbare GON-leerling 99 = Onder voorbehoud aanvaarde leerling Possible values primary education: 01 = Coëfficiënt 1 - 100% financierbaar 02 = Coëfficiënt 1,5 - 150% financierbaar 03 = Niet financierbaar, maar telt wel mee voor de leerplichtcontrole en de financieringswet 11 = Vrije leerling in erkende privéschool 13 = Regelmatige leerling in erkende privéschool 20 = Financierbare GON-leerling 22 = Niet-financierbare GON-leerling
levensbeschouwingCode	string	Religion code

		Possible values: 0000 = Blanco 52 = Cultuurbeschouwing 63 = Eigen cultuur en religie 135 = Islamitische godsdienst 136 = Israëlitische godsdienst 140 = Katholieke godsdienst 187 = Niet-confessionele zedenleer 194 = Orthodoxe godsdienst 225 = Protestants-evangelische godsdienst 418 = Anglicaanse godsdienst 9999 = Vrijstelling of niet van toepassing
verblijfstypeCode	string	Residence type code Possible values: 01 = Externe leerling 02 = Interne leerling (gelijkgesteld met externe leerling) 03 = Semi-interne leerling (gelijkgesteld met externe leerling) 04 = Leerling met revaliderende behandeling (verschillend vd 4 disciplines) 05 = Interne leerling 06 = Semi-interne leerling 07 = Leerling met revaliderende behandeling (één v/d 4 disciplines)
typeBusoCode	string	BuSO type code Possible values: 00 = niet van toepassing 01 = licht mentale handicap 02 = matig of ernstig mentale handicap 03 = ernstige emotionele en/of gedragsstoornissen 04 = fysieke handicap 06 = visuele handicap 07 = auditieve handicap 09 = Autismespectrumstoornis BA = Basisaanbod
isOkan	bool	Indicates whether it is a registration for a foreign-speaking new student
preRegistrationId	GUID	Unique identifier for the pre-registration, linked to a registration. This Id is provided by you when adding a new pre-registration via the "/preregistrations/save"-call. The preRegistrationId can only be returned when the pre-registration is registered via the API and accepted via the student administration module. Format: {42CD5A20-E22F-45D7-973C-FAB8734DEC50} or null if not available
inschrklassen	array	List of class registrations
inschrKlasId	GUID	Unique identifier for the class registration Format: {42CD5A20-E22F-45D7-973C-FAB8734DEC50}
pInschrKlas	integer	Unique integer-value for the class registration within the database. Note: This value may have changed after data migration. Therefore, the inschrKlasId is more suitable as a reference value.
klasId	GUID	Unique identifier for the class Format: {42CD5A20-E22F-45D7-973C-FAB8734DEC50}
pklas	integer	Unique integer-value for the class within the database. Note: This value may have changed after data migration. Therefore, the klasId is more suitable as a reference value.
klasCode	string	Own class code
klas	string	Own class name
groepType	integer	Class type

Students

This chapter describes how to:

- Get all students with a registration for an institute number, school year and reference date;
- Get a student by studentId.

It describes all the available methods, their request/response format and provides input/output examples.

Scope pattern: api_informat_sas_leerlingen.leerlingen.{instituteNo}

GET

/students?schoolYear={schoolYear}&refdate={referenceDate}&changedSince={changedSince}

Gets all students with a registration for a given institute number, school year and reference date falling between registration's begin & end date.

The institute number is defined via the mandatory header "InstituteNo" and the school year must be send via the URL. The ReferenceDate is optional, but will be calculated automatically if not provided (see request for more information).

Request

Headers

Besides the mandatory headers, no other custom headers are required.

URL

Field	Type	Required/optional	Description
schoolyear	string	required	Limits the output results to students which have a registration within the given schoolyear. Format: "2022-23" If not provided a bad request with error code "BR001" and message "Invalid school year" will be returned.
referenceDate	date	optional	Only limits the output results to students which have a registration where the reference date falls between registration's begin & end date, when a reference date is provided . To determine the actual registration (inschrijvingsId property), today's date will be taken if no reference date is provided. In any case the reference date will be overridden as follows if it falls outside the boundaries of the provided school year: - Reference date < beginning of school year => reference date will be overridden with begin date of school year; - Reference date > end of school year => reference date will be overridden with end date of school year.
changedSince	date	optional	Limits the output results to those students whose data has been changed since a certain date. Our internal "changedSince" date is determined based on a collection of change dates at different levels (depending on the content of the response).

Body

This request has an empty body.

Response

The response contains a list of students.

Field	Type	Description
pPersoon	integer	Unique integer-value for the student within the database.
persoonId	GUID	Unique identifier for the student. Format: {42CD5A20-E22F-45D7-973C-FAB8734DEC50}
Naam	string	Student's last name.
Voornaam	string	Student's first name.
Geboortedatum	date	Student's date of birth. Format: yyyy-MM-dd or null if empty
Nickname	string	Student's nickname.
voornaam2	string	Student's additional names.
Initialen	string	Student's initials.
Geboorteland	string	Student's country of birth.
Geboorteplaats	string	Student's place of birth.
nationaliteitCode	string	Student's official nationality codes.
nationaliteit	string	Student's nationality
Rijksregisternr	string	Student's national registration number for Belgium residents. Format: "yymddxxxxx" if provided
Bisnr	string	Students national registration number for a foreign person. Format: 11 characters (digits) if provided
Geslacht	string	Student's sex. Possible values: "M" or "V"
Huisdokter	string	Name of the student's doctor.
telefoonHuisdokter	string	Phone number of the student's doctor.
lOpSchool	integer	Student's place in line at school.
inschrijvingsId	GUID	Unique identifier of the actual registration. The actual registration is determined by the provided InstituteNo, school year, reference date (between registration's begin & end date) and registration status = 0 (gerealiseerd). If no such registration is found, inschrijvingsId will be null.
Thuis taal	string	Student's home language.
leerlingenkaartNummer	string	Studentcard number
fietsNummer	string	Bike number
Adressen	array	List of domicile addresses (usually one).
pAdres	integer	Unique integer-value for the address within the database.
adresId	GUID	Unique identifier for the address. Format: {42CD5A20-E22F-45D7-973C-FAB8734DEC50}
aanspreekTitel	string	Addressable title.
aanspreekNaam	string	Addressable name.
Straat	string	Street name.

Nr	string	House number & Alpha number.
Bus	string	Bus number
Postcode	string	Postal code (main).
Gemeente	string	Town (main).
deelPostcode	string	Sub-municipal postal code
deelGemeente	string	Sub-municipality name
Landcode	string	Country code
isFacturatie	bool	Indicates whether this address is a invoice address.
isAanschrijf	bool	Indicates whether this address is a writing address.
isVerblijf	bool	Indicates whether this address is a residence address.
isOverige	bool	Indicates whether this address is of another type then the provided ones.
Percentage	decimal	Cost allocation percentage.
overigeAdressen	array	List of additional addresses other than the domicile address or the relationship addresses.
pAdres	integer	Unique integer-value for the address within the database.
adresId	GUID	Unique identifier for the address. Format: {42CD5A20-E22F-45D7-973C-FAB8734DEC50}
aanspreekTitel	string	Addressable title.
aanspreekNaam	string	Addressable name.
straat	string	Street name.
nr	string	House number & Alpha number.
bus	string	Bus number
postcode	string	Postal code (main).
gemeente	string	Town (main).
deelPostcode	string	Sub-municipal postal code
deelGemeente	string	Sub-municipality name
landcode	string	Country code
isFacturatie	bool	Indicates whether this address is a invoice address.
isAanschrijf	bool	Indicates whether this address is a writing address.
isVerblijf	bool	Indicates whether this address is a residence address.
isOverige	bool	Indicates whether this address is of another type then the provided ones.
percentage	decimal	Cost allocation percentage.
relaties	array	List of relationships.
pRelatie	integer	Unique integer-value for the relationship within the database.
relatieId	GUID	Unique identifier for the relationship. Format: {42CD5A20-E22F-45D7-973C-FAB8734DEC50}
type	string	Relationship type Examples: Vader, Moeder, Plusvader, Plusmoeder, ...
naam	string	Relation's last name

voornaam	string	Relation's first name
insz	string	Relation's national registration number. This is either the Bisnummer, for foreign pupil, or Rijksregisternummer for Belgium residents. Format: "yymmddxxxxx" Example: "85073115025"
geboortedatum	date	Relation's date of birth. Format: yyyy-MM-dd or null if empty
geslacht	string	Relation's sex. Possible values: "M" or "V"
nationaliteitCode	string	Relation's official nationality codes.
nationaliteit	string	Relation's nationality
beroep	string	Relation's profession.
burgerlijkeStand	string	Relation's civil status.
lpv	integer	Indicates if the relation is marked as a school attendance officer and defines if it's the first or second one.
ophalen	bool	Indicates if the relation picks up the student from school.
isOverleden	bool	Indicates if the relation is deceased.
Opmerkingen	string	The remarks listed for this relationship.
adressen	array	List of addresses linked to the relationship (usually one, and most likely a domicile address).
pAdres	integer	Unique integer-value for the address within the database.
adresId	GUID	Unique identifier for the address. Format: {42CD5A20-E22F-45D7-973C-FAB8734DEC50}
aanspreekTitel	string	Addressable title.
aanspreekNaam	string	Addressable name.
straat	string	Street name.
nr	string	House number & Alpha number.
bus	string	Bus number
postcode	string	Postal code (main).
gemeente	string	Town (main).
deelPostcode	string	Sub-municipal postal code
deelGemeente	string	Sub-municipality name
landcode	string	Country code
isFacturatie	bool	Indicates whether this address is a invoice address.
isAanschrijf	bool	Indicates whether this address is a writing address.
isVerblijf	bool	Indicates whether this address is a residence address.
isOverige	bool	Indicates whether this address is of another type then the provided ones.
percentage	decimal	Cost allocation percentage.
comnrs	array	List of communication numbers linked to the relationship.
pComnr	integer	Unique integer-value for the communication number within the database.
comnrId	GUID	Unique identifier for the communication number.

		Format: {42CD5A20-E22F-45D7-973C-FAB8734DEC50}
nr	string	Communication number.
type	string	Communication number type.
soort	string	Communication number sort. Possible values: Telefoon, Fax or Gsm
opmerking	string	Remark on communication number level
emails	array	List of email addresses linked to the relationship.
pEmail	integer	Unique integer-value for the email address within the database.
emailld	GUID	Unique identifier for the email address. Format: {42CD5A20-E22F-45D7-973C-FAB8734DEC50}
email	string	Email address.
type	string	Email address type. Examples: Eigen, School, Privé, Ouders, ...
schoolcom	bool	Indicates if this email address can be used for school communication purposes.
factuurMailen	bool	Indicates if this email address can be used to mail invoices.
comnrs	array	List of communication numbers not linked to a relationship.
pComnr	integer	Unique integer-value for the communication number within the database.
comnrld	GUID	Unique identifier for the communication number. Format: {42CD5A20-E22F-45D7-973C-FAB8734DEC50}
nr	string	Communication number.
type	string	Communication number type. Examples: Eigen, Privé nummer, Ouders, Vader, Moeder, ...
soort	string	Communication number sort. Possible values: Telefoon, Fax or Gsm
opmerking	string	Remark on communication number level
emails	array	List of email addresses not linked to a relationship
pEmail	integer	Unique integer-value for the email address within the database.
emailld	GUID	Unique identifier for the email address. Format: {42CD5A20-E22F-45D7-973C-FAB8734DEC50}
email	string	Email address.
type	string	Email address type. Examples: Eigen, School, Privé, Ouders, ...
schoolcom	bool	Indicates if this email address can be used for school communication purposes.
factuurMailen	bool	Indicates if this email address can be used to mail invoices.
bankrek	array	List of bank account linked to the student. Returns a "null" or an empty list, if not provided.
type	int	Bank account type. Possible values: 1 = Persoonlijk 2 = Ouders 3 = Vader 4 = Moeder 6 = Voogd 8 = Andere

GET /students/{studentId}?schoolYear={schoolYear}&refdate={referenceDate}

Gets a student by it's studentId. The institute number, school year and reference date are only used to determine the actual registration (inschrijvingsId property).

The institute number is defined via the mandatory header "InstituteNo" and the school year must be send via the URL. The ReferenceDate is optional, but will be calculated automatically if not provided (see request for more information).

Request

Headers

Besides the mandatory headers, no other custom headers are required.

URL

Field	Type	Required/optional	Description
studentId	GUID	required	Limits the output results to a student with the provided studentId. Format: {42CD5A20-E22F-45D7-973C-FAB8734DEC50} If not provided a bad request with error code "BR002" and message "Invalid student id" will be returned.
schoolYear	string	required	Is only used to determine the actual registration (inschrijvingsId property). So this parameter has no limiting effect on the output result. Format: "2022-23" If not provided a bad request with error code "BR001" and message "Invalid school year" will be returned.
referenceDate	date	optional	Is also only used to determine the actual registration (inschrijvingsId property). So this parameter has no limiting effect on the output result. If the reference date is not provided, today's date will be taken. In any case the reference date will be overridden as follows if it falls outside the boundaries of the provided school year: - Reference date < beginning of school year => reference date will be overridden with begin date of school year; - Reference date > end of school year => reference date will be overridden with end date of school year.

Body

This request has an empty body.

Response

The response contains one student instead of a list of students. This makes the response similar to the call "[GET /students?schoolYear={schoolYear}&refdate={referenceDate}&changedSince={changedSince}](#)".

Example request

Request

```
GET https://<endpoint>/<version>/students/c5806777-4bce-4d50-afc5-9cb47f1a5f14?schoolYear=2022-23

```

Photos

This chapter describes how to:

- Get a student's photo by studentId.
- Gets the photo entry for all students with a registration for an institute number, school year.

It describes all the available methods, their request/response format and provides input/output examples.

Scope pattern: api_informat_sas_leerlingen.leerlingen.{instituteNo}

GET /students/{studentId}/photo

Gets a student's photo by studentId. The institute number is defined via the mandatory header "InstituteNo".

Request

Headers

Besides the mandatory headers, no other custom headers are required.

URL

Field	Type	Required/optional	Description
studentId	GUID	required	Limits the output results to a student with the provided studentId. Format: {42CD5A20-E22F-45D7-973C-FAB8734DEC50} If not provided a bad request with error code "BR002" and message "Invalid student id" will be returned.

Body

This request has an empty body.

Response

The response contains one photo object.

Field	Type	Description
Id	Guid	Unique identifier which identifies the photo.
persoonId	Guid	Unique identifier for the student. Same as the studentId provided via the url. Format: {42CD5A20-E22F-45D7-973C-FAB8734DEC50}
foto	string	Base64-encoded string representation of the photo.

Example request

Request

```
GET https://<endpoint>/<version>/students/c5806777-4bce-4d50-afc5-9cb47f1a5f14/photo
HTTP/1.1
InstituteNo: 999999

Accept: application/json
Content-Type: application/json
```

Response

The response contains a list of photo references.

Field	Type	Description
Id	Guid	Unique identifier which identifies the photo.
persoonId	Guid	Unique identifier for the student.
fotoUrl	string	A fully qualified URL pointing to the GET {version}/students/{studentId}/photo endpoint, allowing to fetch the actual photo content for that student.

Example request

Request

```
GET https://<endpoint>/<version>/students/photos?schoolYear=2022-23 HTTP/1.1

School history

This chapter describes how to:

- Get an overview of the school history for all students who have a registration with status "Gerealiseerd" within the provided institute number and school year.
- Get an overview of the school history for a student by the provided studentId.

It describes all the available methods, their request/response format and provides input/output examples.

Scope pattern: api_informat_sas_leerlingen.leerlingen.{instituteNo}

GET /schoolHistory?schoolYear={schoolYear}&certificateSource={certificateSource}

Gets a "school history" overview for all students who have a registrations with status "Gerealiseerd" within the provided institute number and school year. The institute number is defined via the mandatory header "InstituteNo" and the school year must be send via the URL.

Request

Headers

Besides the mandatory headers, no other custom headers are required.

URL

Field	Type	Required/optional	Description
schoolYear	string	required	Limits the output results to registrations within the given schoolyear. Format: "2022-23" If not provided a bad request with error code "BR001" and message "Invalid school year" will be returned.
certificateSource	integer	optional	Is an optional parameter, used to filter the obtained certificates by source. Possible values are: 0 (Informat) or 1 (Discimus). So, value 0 means that certificates registered in informat will appear in the list. While value 1 means that the certificates read in from Discimus will appear in the list. If not provided via the URL, value 0 will be taken.

Body

This request has an empty body.

Response

The response contains a list of "school history" object.

Field	Type	Description
pPersoon	integer	Unique integer-value for the student within the database.
persoonId	Guid	Unique identifier for the student. Format: {42CD5A20-E22F-45D7-973C-FAB8734DEC50}
schooljaar	string	Schoolyear in which the registration falls. Format: "2022-23"
instelnr	string	Official institute number of the school Format: 6 characters (digits)

school	string	Descriptive name of the school.
vanDatum	date	Date the registration starts Format: : yyyy-MM-dd
totDatum	date	Date the registration ends Format: : yyyy-MM-dd or null if empty
nrAdmgrp	string	Official education number (Nr administratieve groep). Format: 6 characters (digits)
admgrp	string	Official education name.
studiebewijzen	array	List of certificates linked to the registration.
studiebewijs	string	Name of the obtained certificate. For example, if it's a "Certificate of Professional Qualification" then certificate name can/will be supplemented with the name of the professional qualification. For example: "Bewijs van beroepskwalificatie: Medewerker groen- en tuinbeheer".
uitreiking	date	Issue date of the certificate. Format: : yyyy-MM-dd
clausulering	string	When a student has passed with a B certificate, the clauses will be shown for which the student can't choose 1 or more finalities, forms of education and/or fields of study in a subsequent year.

```

GET /schoolHistory/{studentId}?certificateSource={certificateSource}

Gets a “school history” overview for a student by studentId.

Request

Headers

Besides the mandatory headers, no other custom headers are required.

URL

Field	Type	Required/optional	Description
studentId	GUID	required	Limits the output results to a student with the provided studentId. Format: {42CD5A20-E22F-45D7-973C-FAB8734DEC50}

Body

This request has an empty body.

Response

The response contains the school history for one student instead of a list of students. This makes the response similar to the call “[GET /schoolHistory?schoolYear={schoolYear}&certificateSource={certificateSource}](#)”.

Example request

Request

```
GET https://<endpoint>/<version>/SchoolHistory/c5806777-4bce-4d50-afc5-9cb47f1a5f14&certificateSource=0

BR017	Invalid Religion
BR018	Invalid Priority Group
BR019	Invalid Reason For Refusal
BR020A	Max 2 Relationships are allowed
BR021	Relationship: Invalid Type
BR022A	Relationship: Last Name is required
BR022B	Relationship: Last Name doesn't comply with the validationrule: max. length 50
BR023A	Relationship: First Name is required
BR023B	Relationship: First Name doesn't comply with the validationrule: max. length 30
BR024A	Relationship: Street Name is required
BR024B	Relationship: Street Name doesn't comply with the validationrule: max. length 50
BR025A	Relationship: House No is required
BR025B	Relationship: House No doesn't comply with the validationrule: max. length 10

BR026	Relationship: House Bus No doesn't comply with the validationrule: max. length 6
BR027A	Relationship: Postal Code is required
BR027B	Relationship: Postal Code doesn't comply with the validationrule: max. length 8
BR028A	Relationship: City is required
BR028B	Relationship: City doesn't comply with the validationrule: max. length 30
BR029A	Relationship: Country Code is required
BR029B	Relationship: Country Code must have a lenght of 5 characters
BR030	Relationship: Phone doesn't comply with the validationrule: max. length 20
BR031	Relationship: Mobile Phone doesn't comply with the validationrule: max. length 20
BR032	Relationship: Invalid Email
BR043A	Relationship: Invalid Insz
BR033	Invalid Pre Registration Id
BR034A	Schoolyear is required
BR034B	Invalid Schoolyear
BR035A	Institute is required
BR035B	Institute must have a lenght of 6 characters
BR036A	Structure is required
BR036B	Structure must have a lenght of 3 characters
BR037A	Location Id is required
BR037B	Location Id must have a lenght of 3 characters
BR037C	Invalid LocationId {locationId} for this institute
BR038A	Admgrp Id is required
BR038B	Admgrp Id must have a lenght of 6 characters
BR039	Admgrp Detail doesn't comply with the validationrule: max. length 200
BR040A	Pre Registration Date is required
BR040B	Pre Registration Date must be on or before the Start date
BR041A	Start Date is required
BR041B	Start Date must be between beginning and end of defined school year, or 01.09 of next school year for toddlers under minimum age
BR042	Invalid Registration Status

Data Not Found errors

Code	Description
DNF001	No registration found for Pre Registration Id {preRegistrationId}.

Method Not Allowed errors

Code	Description
MNA001	This Pre-Registration is already accepted, and can no longer be changed
MNA002	This Pre-Registration has been refused, and can no longer be changed
MNA003	This Pre-Registration is already accepted, and can no longer be deleted
MNA004	This Pre-Registration has been refused, and can no longer be deleted
MNA005	Changing this Pre-Registration to an update of personal details isn't allowed

API version history

The table below tracks the history of the different versions of the WEB API and their respective release dates. The version number corresponds to the version number used in the URL. The type can be initial / minor / major.

Api Version	Release Date	Type	Changelog
1	June 23, 2020	Initial release	- Version 1
1.5	July 1, 2021	Minor	- Request validation: valid JSON type
1.6	October 18, 2022	Minor	- New property "Insz" added at relationship level. When an invalid Insz number is provided, a BR043A error will be returned.
1.7	November 25, 2022	Minor	- Changes made regarding "update personal details"-registration: - preRegistrationDate is only required if admgrpId is not equal to "000000" (no admgrp) - MNA005 validation error added: Changing this Pre-Registration to an "update of personal details" isn't allowed
1.8	January 10, 2023	Major	- The following 3 new calls are implemented: - GET /preregistrations/{preregistrationId}/status - GET /students?schoolYear={schoolYear}&refdate={referenceDate} - GET students/{studentId}?schoolYear={schoolYear}&refdate={referenceDate}
1.9	February 7, 2023	Minor	- New property "assignedViaRegistrationSystem" added to the "/preregistrations/save" call. As optional and with default value false.
1.10	April 25, 2023	Minor	- The following 2 calls are extended with parameter "changedSince": - GET /registrations?schoolYear={schoolYear}&changedSince={changedSince} - GET /students?schoolYear={schoolYear}&refdate={referenceDate}&changedSince={changedSince}
1.11	June 6, 2023	Minor	- New property "preRegistrationId" added to the response of the "GET /registrations" call.
1.12	June 20, 2023	Minor	- Additional LocationId validation added to the "/preregistrations/save" call. If the LocationId is formatted correctly, a check is done to verify whether this id exists within the students admin module for the provided instituteNo and school year. ("BR037C"). - Validationrule "BR023B" (Relationship: First Name) changed: max. length 50 => max. length 30.
1.13	March 5, 2024	Minor	- Relationship type 0 (leerling) added to the "/preregistrations/save" call. The purpose of this type is to be able to send the address of an adult pupil without creating a relationship.
1.14	May 21, 2024	Minor	- The following new call is implemented: GET /students/{studentId}/photo
1.15	July 3, 2024	Minor	- The response of the following calls is extended with Bank accounts: - GET /students?schoolYear={schoolYear}&refdate={referenceDate} - GET /students/{studentId}?schoolYear={schoolYear}&refdate={referenceDate}

Api Version	Release Date	Type	Changelog
			See next page - The following new calls are implemented: - o GET /schoolHistory?schoolYear={schoolYear}&certificateSource={certificateSource} - o GET /schoolHistory/{studentId}?certificateSource={certificateSource}
1.16	September 25, 2024	Minor	- Relationship type 7 (pleegvader) and type 8 (pleegmoeder) added to the "/preregistrations/save" call. - The response of the following calls is extended with a studentcard number (leerlingenkaartNummer) and a bike number (fietsnummer); a new property Country Code (landcode) was added to the addresses. - o GET /students?schoolYear={schoolYear}&refdate={referenceDate} - o GET /students/{studentId}?schoolYear={schoolYear}&refdate={referenceDate}
1.17	November 12, 2024	Minor	- Plnschr, inschrKlasId, klasId & pKlas are added to the response of GET /registrations?schoolYear={schoolYear}&changedSince={changedSince} call.
1.18	November 27, 2024	Minor	- PlnschrKlas is added to the response of GET /registrations?schoolYear={schoolYear}&changedSince={changedSince} call.
1.19	January 20, 2025	Minor	- In addition to the official/main classes and sub classes, OLOD groups will also be returned as "GroepType" in the response of GET /registrations?schoolYear={schoolYear}&changedSince={changedSince}.
1.20	September 30, 2025	Minor	- Class teachers (klassenleraars) is added to the response of GET /registrations?schoolYear={schoolYear}&changedSince={changedSince} call
1.21	October 13, 2025	Minor	- The response for the following calls is extended with "overigeAdressen". These are the addresses other than the domicile address or the relationship addresses. - o GET /students?schoolYear={schoolYear}&refdate={referenceDate}&changedSince={changedSince} - o GET /students/{studentId}?schoolYear={schoolYear}&refdate={referenceDate}
1.22	March 31, 2026	Minor	- The response of the following calls is extended with "Opmerkingen" on Relationship-level: - o GET /students?schoolYear={schoolYear}&refdate={referenceDate} - o GET /students/{studentId}?schoolYear={schoolYear}&refdate={referenceDate} - The following new call is implemented: - o GET /preregistrations?schoolYear={schoolYear} - The response of the following call is extended with "Afdeling" - o GET /registrations?schoolYear={schoolYear}& changedSince={changedSince} - The following new call is implemented: - o GET /students/photos?schoolYear={schoolYear}
1.23	April 28, 2026	Minor	- For the "GET /students?schoolYear={schoolYear}&refdate={referenceDate}" endpoint, the way of filtering on referenceDate has been changed. Now, it only limits the output result when there is a date provided.

Api Version	Release Date	Type	Changelog
			- For the "POST /preregistrations/save" endpoint, the validation on start date has been changed. Now, September 1st of the next school year is also valid if the toddler is younger than 2.5 years on the last entry date (being the first school day after Ascension Day of the provided school year).
1.24	May 12, 2026	Minor	- The response for the following endpoints is extended with comnrld (GUID) & remark for the comnrs blocks and with emailld (GUID) for the emails blocks on both student and relationships level: - o GET /students?schoolYear={schoolYear}&refdate={referenceDate} - o GET /students/{studentId}?schoolYear={schoolYear}&refdate={referenceDate} - The response for endpoint "GET /registrations?schoolYear={schoolYear}" is extended with afdelingsjaarOptie.
1.25	September 8, 2026	Minor	- The "GET /students?schoolYear={schoolYear}&refdate={referenceDate}" and GET /students/{studentId}?schoolYear={schoolYear}&refdate={referenceDate} endpoints are extended with: - o adressenEmail array, showing the linked email addresses (emailld) to addresses (addressld), including email addresses without a 'Relationship'. - o Addresses are extended with deelPostcode and deelGemeente. - o The response is extended with Thuistaal (home language). - o The Nationaliteit (nationality) is added for the students and their relations. - The response for endpoint "GET /registrations?schoolYear={schoolYear}" is extended with vestnrDiscimus, verblijfstypeCode and typeBusoCode.
